Subscription Revenue Measurement

Subscription Revenue Measurement · https://tenjin.com/ja/docs/subscription-revenue-overview/

Subscription Revenue Tracking shows you how much money your subscriptions really make and which campaigns brought in the users who pay. Tenjin gets subscription data straight from the App Store and Google Play, so you don't have to send revenue events from your app yourself.

Ready to set it up? Go to Set Up Subscription Revenue Measurement.

What you get

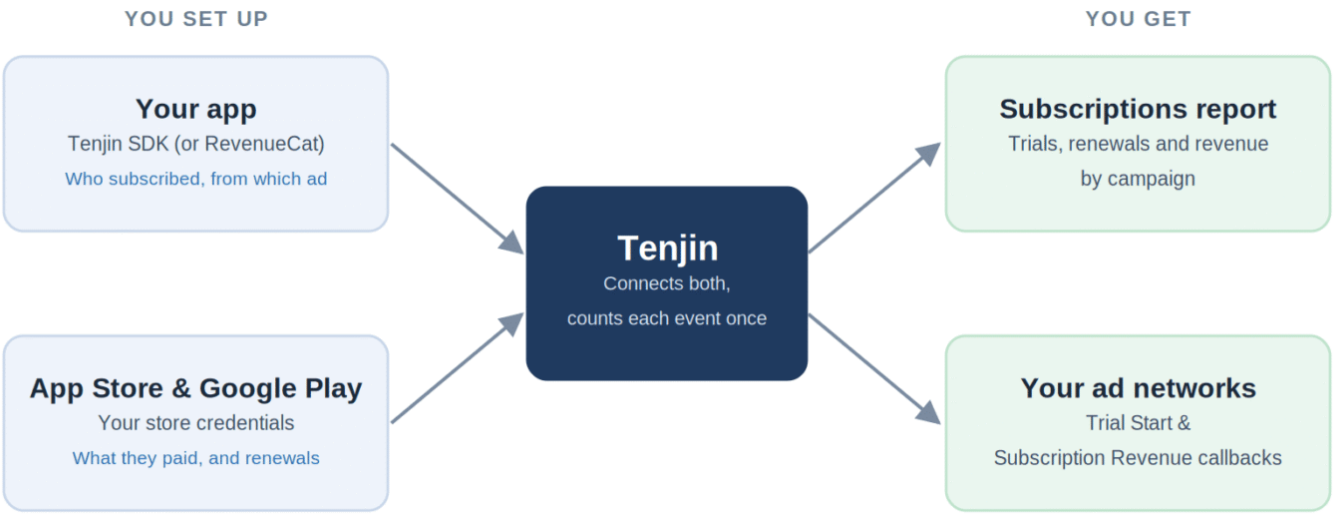

- **Your full revenue in one place.** Subscription revenue is added to your IAP and ad revenue, so your total revenue, LTV and ROAS include everything your app earns.
- **Trials, renewals and cancellations, by campaign.** See which channels and campaigns bring in users who start trials, convert to paid, and keep renewing.
- **Better ad optimization with one switch.** Send **Trial Start** and **Subscription Revenue** events to your ad networks. They're built in, so there are no custom events to set up.
- **No double counting.** Each trial, payment and renewal is counted once, even if the same purchase also comes in as an in-app purchase, or from RevenueCat.

How it works

Setup has two main parts, and each one gives Tenjin a different piece of the picture:

Part	What it tells Tenjin	Without it
Tenjin SDK (or RevenueCat)	**Who** subscribed: which user, and which ad campaign brought them in	You'd see subscription revenue, but not which campaign it came from
Store credentials	**What** they bought: price, currency, trial status, renewals and cancellations	Tenjin would know a purchase happened, but not what it's worth or whether it renewed

Together, they give you subscription revenue connected all the way back to the ad that brought in the user.

A simple example

A user clicks your Meta ad, installs your app, and starts a 7-day free trial. Here's what happens:

1. **Day 0:** The trial shows up in your Subscriptions report as a **New Trial**, connected to that Meta campaign. If your Trial Start callback is on, Meta gets the event too.
2. **Day 7:** The trial converts to a paid monthly plan. You see a **New Subscription** and its revenue. Meta gets a **Subscription Revenue** event with the amount.
3. **Every month after:** Each payment shows up as a **Renewal**, and your campaign's LTV and ROAS keep growing.
4. **If they cancel:** You see a **Cancelled Subscription**.

Tenjin keeps checking each subscription with the store automatically until it ends. You don't need to configure anything.

Supported platforms

- **Stores:** App Store (iOS) and Google Play (Android)
- **SDKs:** iOS, Android, Unity, React Native and Flutter
- **Subscription platforms:** RevenueCat (no SDK work needed)

Subscription metrics

These metrics are in the Subscriptions report:

Metric	What it counts
New Trials	Free trials started

Metric	What it counts
New Subscriptions	First-time paid subscriptions
New Subscriptions Revenue	Revenue from first-time paid subscriptions
Renewals	Subscription renewals (repeat payments)
Renewals Revenue	Revenue from renewals
All Subscriptions Revenue	New Subscriptions Revenue + Renewals Revenue
Cancelled Subscriptions	Subscriptions cancelled by the user or the store

Compare plans with product_id

product_id is the name of each subscription plan as it's set up in App Store Connect or Google Play Console (for example, `com.yourapp.premium.monthly`). Group your report by product_id to compare plans, for example, how your monthly and annual plans convert and renew.

Subscription revenue in your total revenue, LTV and ROAS

Subscription revenue is automatically included in Tenjin's combined revenue metrics. This applies to Revenue, LTV, ROAS and ROI, for example:

- Revenue
- LTV D7
- ROAS D30
- ROI D90

These use ad mediation revenue for the ad revenue part. Each one also has a **Network** version that uses ad revenue reported by ad networks (for example Network ROAS D30). Cohort metrics are available for any day from D0 to D365.

Subscription callbacks

Trial Start and **Subscription Revenue** are built-in callbacks, right next to Install and In-App Purchase on the Callbacks tab. Turn them on per channel, and Tenjin sends the events for you. You don't need to create custom events or change your app.

- **Trial Start** helps networks find more users who start trials.
- **Subscription Revenue** lets networks bid for users who actually pay and renew.

See how to turn on callbacks

Using RevenueCat

If you use RevenueCat, add your store credentials in Tenjin and turn on the Tenjin integration in RevenueCat. You don't need the Tenjin SDK subscription method. You get the same Subscriptions report and the same one-switch callbacks.

Tenjin combines both sources and removes duplicates automatically, so each event is counted once. See the FAQ below for how to set up your callbacks.

FAQ

Can I use Tenjin subscription tracking alongside RevenueCat or other third-party purchase integrations?

Why are my Tenjin numbers different from RevenueCat's?

Will subscription revenue be counted twice with my IAP revenue?

Do I need a developer to set this up?

How long until I see data?
